Correlation between instant measures of soil temperature and mean soil temperature during the period April 1st – June 5th recorded by loggers

For each logger_nr, get mean temperature during April-June and compare with temp_term (which was measured with a thermometer at 10 cm depth on May 2017):

```
with(logger_data%>%
       mutate(month = month(datetime)) %>%
       filter(month==4|month==5|month==6)%>%
       filter(above_below=="B")%>%
       mutate(date=date(datetime))%>%
       filter(!is.na(date))%>% # remove records with no info on date
       filter(datetime<"2018-06-06")%>% # keep only data until June 5
       group_by(logger_nr) %>%
       summarize(mean_logger=mean(temp),temp_term=mean(temp_term)),
     cor.test(mean_logger,temp_term))
```

```
##
##  Pearson's product-moment correlation
##
## data:  mean_logger and temp_term
## t = 21.901, df = 139, p-value < 2.2e-16
## alternative hypothesis: true correlation is not equal to 0
## 95 percent confidence interval:
##  0.8370572 0.9129479
## sample estimates:
##       cor
## 0.8805259
```

Is soil temperature more weakly correlated with air temperature in warmer soils?

For each date and logger pair, calculate mean, max and min of air and soil temperature (from, respectively, the above and belowground logger). Then, calculate the correlation coefficient for air and soil temperatures over the period May or April-May-June. Finally, regress these correlation coefficients on mean soil temperature (from the belowground logger) for the same period (April-May-June).

May

```
data_corr<-(logger_data_pairs%>%
     mutate(month = month(datetime),date=date(datetime))%>%
              # new variables "month" and "date"
     filter(month==5)%>% # keep data from may
     group_by(date,pair,above_below)%>%
     summarise(mean=mean(temp,na.rm=T),max=max(temp),min=min(temp))%>%
   #calculate mean, max and min of air and soil temperature
     pivot_wider(names_from="above_below",values_from=c("mean","max","min"))%>%
     group_by(pair)%>%
     summarise(corr_airsoil_mean=cor(mean_A,mean_B,use="pairwise.complete.obs"),
               corr_airsoil_max=cor(max_A,max_B,use="pairwise.complete.obs"),
               corr_airsoil_min=cor(min_A,min_B,use="pairwise.complete.obs"))%>%
   # Calculate correlations air-soil temperatures
     pivot_longer(cols=corr_airsoil_mean:corr_airsoil_min,
                  names_to="measure",values_to="corr")%>%
  left_join(logger_data_pairs%>%
                 mutate(month = month(datetime))%>%
                 filter(month==5)%>%
                 filter(above_below=="B")%>%
                 group_by(pair)%>%
              summarise(meansoiltemp=mean(temp))))
  # calculate mean soil temperature for may
```

```
model_mean<-lm(corr~meansoiltemp,
               data = subset(data_corr,measure=="corr_airsoil_mean"))
